Lote C.J., Weiss J.B.;

"Identification in urine of a low-molecular-weight highly polar
glycopeptide containing cystein/j-galactose.";

Biochem. J. 123:25P-25P(1971).

-I- FUNCTION: THE IDENTITY OF THE GLYCOPROTEIN FROM WHICH THIS PEPTIDE
IS DERIVED IS UNRNOWN. NO PHYSIOLOGICAL FUNCTION HAS BEEN
ATTRIBUTED. AN ERYTHROCYTE MEMBRANE GLYCOPEPTIDE HAVING A
SIMILAR STRUCTURE HAS ALSO BEEN FOUND.
   01-NOV-1995 (Rel. 32, Last annotation update)

C; Accession: A44873
A; Title: Determination of the phosphorylation sites of smooth muscle caldesmon by protein
A; Reference number: A44873
A; Accession: A44873
A; Status: preliminary
A; Molecule type: protein
A; Residues: 1-9 < IKE>
A; Residues: 1-9 < IKE>
A; Residues: 1-9 < IKE>
A; Experimental source: skeletal myosin
A; Note: sequence extracted from NCBI backbone (NCBIP:63199)
C; Superfamily: caldesmon

                                                                                                                                                                                                                                                                                                                                                                                                                       or antigonists (Tb) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma calls that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatablilty complex; MHC; B cell; disease; anti-tumour; anti-viral.

immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC class I allele HLA-A2.1.

leukocyte antigen (HLA), HLA-A2.1 and are used to exemplify the method of invention of producing antigen-specific cytotoxic T cells (CTLS) in vitro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC) antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (APCS) pretreated with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing offs pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLS which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CTLS can be used for treating canners, immune disorders, viral infections, contactions, malaria or contactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic peptide having a human leukocyte antigen binding motif #2266
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA;

                                                                                                                                                                                                 The peptide epitope W77119-W77138 were created for human tumour-specific cytocoxic T lymphocyte response. These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human leukocyte antigen; HLA; tumour associated antigen; cancer;

HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans).

They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell are an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                            ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to Kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                     produce CTLS ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.

ö
immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                         Gaps

(Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use. In adoptive transfer therapy. (Ib) are used to inhibit CEA-specific. Immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generate a compart of the present sequence (I) and sequence represents a specifically claimed example of (Ia).

The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, ung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Allele-specific binding motif; major histocompatibility complex; MHC; HLA; HLA-A2.1; cytotoxic T cell response; antigen; microbial infection; hepatitis; AIDS; malaria; condyloma acuminatum; cancer; prostate cancer; renal carcinoma; cervical carcinoma; lymphoma; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
Carcinoembryonic antigen; CEA; human; agonist; antagonist; immune response; carcinoma; gastrointestinal; breast; pancreatic; bladder; ovarian; lung; prostatic; T cell proliferation; cancer; adoptive transfer therapy; autoimmune reaction; immunotherapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               allele specific binding motif for the major histocompatibility complex (MHC) molecule HLA, e.g. HLA-A2.1. The peptides have conserved residues at certain positions such as positions 2 and 9. Also, the peptides do not comprise negative binding residues at other positions, such as positions comprise negative binding residues at other positions, such as positions 1, 3, 4, 5, 7, 8 and/or 7 (peptides 9 amino acids long). The peptides are used to induce a cytocoxic T cell response to a preselected antigen. The method comprises contacting cytotoxic T cells from a patient (optionally expressing a specific MHC class I allele) with the present peptides.

The peptides are used to treat and prevent microbial infection, AIDS, viral hepatitis B and C, human papilomavirus (HPV) infection, AIDS, viral hepatitis B and C, human papilomavirus (HPV) infection, AIDS, viral hepatitis B and C, human papilomavirus (HPV) infection, AIDS, cytomegalovirus (CM), malaria, and condyloma acuminatum) and cancer (e.g. prostate cancer, renal carcinoma, cervical carcinoma, lymphoma). Patients in the acute phase of infection can be treated with the peptides in conjunction with other treatments. The antigenic peptides may be used to elicit cytotoxic T lymphocytes (CTLS) ex vivo and in vivo. The resulting CTLS can be used to treat chronic infections (viral consecrial) or tumours in patients that do not respond to conventional corms of therapy. The peptides may also be used to produce monoclonal antibodies, which are useful as potential diagnostic or therapeutic agents. The peptides may also be used as diagnostic reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing carcinoembryonic antigen (CEA) specific human cytotoxic T cells (CTC), comprises introducing a 1st pox virus vector, having at least 1 insertion site containing a DNA segment encoding a CEA peptide (i.e. the present peptide) to a host to stimulate CTC production, and at least 1 periodic interval after that, contacting the host with an additional antigen. The CEA specific CTC can be used to determine the CTC eliciting epitope of CEA, and to screen for compounds which enhance the ability of the antigen to create a CTC response. A host with a CEA expressing tumour can be treated by introducing the CTC to the host, and at least 1 periodic interval after that introducing a CEA peptide, i.e. the present peptide.

The present peptide is positive for binding to HLA-A2, and scored so and 806 in T2 cell binding assays, where the binding of an appropriate peptide results in the upregulation of surface HLA-A2 on the T2 cells, which can be quantified via FACScan using an anti-HLA-A2 antibody (background 280 and 300).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                              for lead compounds for developing such compounds). The ligands are potentially useful therapeutically, e.g. as neuroprotectants during ischemia and for treatment of stroke, head injuries, epilepsy, neuropathic pain etc. The method allows affinity of ligands to be estimated without having to prepare them and then test them, in vitro. Ligands with high selectivity for particular glutamate receptors should have fewer side effects than known receptor antagonists.
                                                                                                                                                                              W76226-W76250 are protein fragments used in the design of a model of a protein-ligand binding pocket (PLBP) of a binding protein. A model is constructed based on typographic similarity to the binding pocket of a bacterial periplasmic binding protein. The model is refined by energy minimisation, with a high affinity ligand in the binding pocket. Interaction energies of basis set molecules (BSM) are obtained by calculating energy of the models for the binding pocket BP and BSM individually (Er and Em) and total energy (Erm) of bound complexes formed. The model is used to predict the selectivity of a potential ligand for a set of related PLBP's, specifically innorropic glutamate receptors. Identified ligands are potentially useful for studying receptor binding and activity and as modulators of receptor activity
                                                                            Designing a model for a ligand-binding pocket in a protein and its use for assessing ligand affinity - without the need to prepare test ligand, for identifying selective antagonists for ionotropic glutamate receptors, potentially useful as neuroprotectants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Teratocarcinoma-derived growth factor (CRIPTO-1) antigenic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treatment; prevention; cure; anti-tumour vaccine; metastases; breast; bladder; prostate; pancreas; ovary; thyroid; colon; stomach; carcinoma; MHC class I; HLA-A2; human; Major Histocompatibility Complex; uroplakin; prostate specific antigen; prostate specific membrane antigen; prostate acid phosphatase; mucin; lactadherin; teratocarcinoma derived growth factor; PSA; PSNA; PAP; CRIPTO-1.

Tumour associated antigen peptides (TAA) may be used for the treatment, prevention and cure of cancer or cancer metastases. The cancer may be breast, bladder, prostate, pancreas, ovary, thyrold, colon, stomach, head or neck cancer or a carcinoma. The tumour associated antigens are presentable to the immune system by HLA-A2 molecules and are generally between 8 to 10 amino acids in length. The amino acids located at positions 2 and 9 of the tumour associated antigens are the anchor residues which participate in the binding to MHC class I molecules, more specifically HLA-A2. More tumour associated antigens are described in GENESEO records Y82306-Y82882.
                                                                                                                                                                                                                                                                                                                                           Tumor associated antigen peptides, especially derived from uroplakin, useful as vaccines to prevent or cure cancers including breast, bladder, prostate, pancreas, ovary, thyroid, colon and stomach -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Those tumour associated antigens described in records 182806-18284 and 18285-1982869 are derived from Uroplakin, such as Uroplakin II, Uroplakin III, Those described in records 182825-182829 are derived from prostate specific antigen (PSA). Those described in records 182825 are derived from prostate specific antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prostate specific membrane antigen (PSMA). Those described in records YY82836-Y82839 are derived from prostate acid phosphotase (PAP). Those described in records Y82840-Y82846 are derived from Lactadherin (BA-46). Those described in records Y82841-Y82884 are derived from Mucin and those described in records Y82841-Y82884

                                                                                                                                           The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver, and lymph node. The peptide bind to the membrane dipeptidase (MDP). Y48618 to Y49066 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence is an insert in the CDR1 of the variable-like domain (VLD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New binding agent comprising monomeric V-like domain in which at least one complementarity determining region loop is modified, useful for
                                                                                                                                                                                                                                                                                   Gaps
                                                                                    New peptides which selectively home to organs or tissues, used for, e.g. identifying target ligands and for therapy of pathological

of the human cytotoxic T-lymphocyte associated antigen 4 (CTLA-4), used in the binding agent of the invention. The binding agent (I) comprises at least one monomeric VLD that is derived from a non-antibody ligand and has at least one CDR (complementarity determining region) loop sequence.

Or part of it, modified or replaced so that, compared to unmodified VLD, its solubility is increased and/or the size is altered and/or a clisulphide bond is created within, or between, one or more CDR loops. (I) are used for diagnosis, e.g. in vivo detection/localisation of cancer, blood clots etc., also in vitro when immobilised on solid supports or blood clots etc., also in vitro when immobilised on solid supports or bloosensors and therapeutically. Modified VLD may have binding affinity for drugs, steroids, pesticides, andigens, growth factors, tumour and alters binding specificity. Since VLD are derived from human proteins, the need for a humanizing step (to avoid adverse immune responses) is avoided, and modification also improves expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences shown in W70027 to W70043 represent peptides derived from MAGEZ and MAGE3 and Integens. The peptides can bind to a human leukocyte antigen (HLA), HLA-A2.1 and are used to exemplify the method of invention of producing antigen-specific cytotoxic T cells (CTLS) in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MAGE 3 antigen derived HLA-A2.1 binding peptide 9 (residues 174-182)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

vitro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (APCS) pretreated with pretreatment growth factors, and incubating the APCs with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen:specific CTLs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytocoxic T cells with APCs pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLs which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, viral infections, the contactions, hepstilis, bacterial infection, fungal infection, malaria or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunogenic peptide having a human leukocyte antigen binding motif #1764.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    V45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex. (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic response against the antigen from which the peptide is derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinome;

concer, by contacting or otherwise at risk of viral infection or used to treat the condition of a peptide fragment bound to a HLA molecule, rather than the intext foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) or prevent viral infections and cancers in mammals (especially humans) concer, or prevent viral infections and cancers in mammals (especially humans). They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cyctoxic T cell response, by contacting a cyctoxic T cell with the peptide e.g. to produce CILE ax vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HAA-AB or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic I lymphocytes (CTLs) which destroy antigen-bearing cells are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunogenic peptide having a human leukocyte antigen binding motif #2091
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighthing viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, ALDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also mown as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytoctoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic peptide having a human leukocyte antigen binding motif #2174.
to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The polynuclectides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes antagonists which specifically prevent laminin interaction with nidogen which is essential in the supramolecular assembly of basement membranes. These antagonists can be used as therapeutic agents in diabetic patients where basement membrane thickening leads to chronic renal failure and blindness (retinopathy). Several other vascular injuries including vasculitis, scleroderma and systemic lupus can also be treated by the antagonists. Further, the antagonists can break down basement membrane formation around tumour cells to allow attack of the cells by antibodies and immune cells. The present sequence was used in the preparation of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IgG anti-BSA antibodies. Thus, BSA may represent a target antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.

Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IgG anti-BSA antibodies. Thus, BSA may represent a target antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Neuroendocrine; antigen; diabetes mellitis; pancrease; insulinoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of amilarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IgG anti-BSA antibodies. Thus, BSA may represent a traget antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.

Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IgG anti-BSA antibodies. Thus, BSA may represent a target antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.
may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.

                                                                                                                                                                                                                                                                                                                                                                           ó
                                                                                                                                Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IgG anti-BSA antibodies. Thus, BSA may represent a target antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IGG anti-BSA antibodies. Thus, BSA may represent a target antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA

Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IgG anti-BSA antibodies. Thus, BSA may represent a target antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neuroendocrine; antigen; diabetes mellitis; pancrease; insulinoma; PM-1; bovine serum albumin; BSA; epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IGG anti-BSA antibodies. Thus, BSA may represent a leastet antigen for row milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.

                                                                                                                                                                                                                                                                                                                          ö
                                   Sequence analysis of the PM-1 protein revealed two regions of similarity with bovine serum albumin (BSA). These regions of similarity may contain epitopes shared by the PM-1 molecule and BSA. It has been shown that many patients with Type I diabetes have elevated levels of anti-IgG anti-BSA antibodies. Thus, BSA may represent a target antigen for cow milk induced islet autoimmunity. Peptides comprising amino acids residues shared by the PM-1 protein and BSA may be useful in the form of a therapeutic composition to treat an autoimmune disease, such as Type I diabetes in an individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This synthetic peptide is an example of a kidney-homing peptide that was identified using a claimed method for obtaining that was identified using a claimed organ or tissue. This in vivo molecules that home to a selected organ or tissue. This in vivo panning method typically involves administering a phage display. I ibrary to a subject, and identifying expressed peptides which home to the desired organ or tissue, e.g. brain, kidney, angiogenic vascular tissue or tumour tissue. The isolated peptides (see M1312-52, W1181-86) can be used to target e.g. drugs, toxins or labels to the selected organ/tissue (claimed) or to identify and/or isolate target molecules (claimed). The peptides can be directly inductive in vivo, as compared to prior art in vitro screening specificity in vivo.

                                                              The peptide mimetics W61734-W61756 and W77001-W77014 mimic a loop on the gamma-chain of cytokine receptors, and interacts with a cytokine or a gamma-chain partner receptor chain of a heterodimenic cytokine receptor. They inhibit signal transduction mediated by cytokine:receptor binding (of cytokines that bind to receptors with a gamma-chain). They are used to inhibit or suppress cytokine-mediated immune responses, growth, proliferation, function and activity of cells. Particularly they are used for treatment or prevention of Lymphoma, leukaemia, allergy (e.g. asthma), autoimmune disease (e.g. rheumatoid arthritis, lupus, multiple sclerosis or myasthenia gravis), graft vs. host disease and transplant or graft rejection. They inhibit function of interleukin (IL)-2, -4, -7, -9, -13 and -15 (the receptors for which include a common gamma -chain), so function as immunosuppressants by reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          W40264-W40275 are peptide fragments of an R-specific amidohydrolase isolated from Klebsiella oxytoca strain PRS1. This enzyme allows the microorganism to utilise 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-1soforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Tr1:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation
- by stereoselective hydrolysis of corresponding racemic amide using
microorganism or derived enzyme, used as drug intermediate

Tumour associated antigen peptides (TAA) may be used for the treatment, prevention and cure of cancer or cancer metastases. The cancer may be breast, bladder, prostate, penciesa, ovary, thyroid, colon, stomach, head or neck cancer or a carcinoma. The tumour associated antigens are presentable to the immune system by HiA-A2 molecules and are generally between 8 to 10 amino acids in length.

The amino acids located at positions 2 and 9 of the tumour associated antigens are described in garticipate in the binding to migens are the anchor residues which participate in the binding to MMC class I molecules, more specifically HiA-A2. More tumour associated antigens described in GRNESE records Y82806-Y8282 and Y82825-Y82869 are derived from Uroplakin, such as Uroplakin III and Uroplakin ib. Those described in records Y82835 are derived from CC Groods Y82825-Y82839 are derived from prostate specific antigen (PSA). Those described in records Y82835-Y82839 are derived from prostate acid phosphotase (PRA). Those described in records Y82846-Y82856 are derived from CC Front Lactadherin (BA-46). Those described in records Y82846 are derived are derived from Mucin and those described in records Y82847-Y82856.

Those described in records Y82846-Y82846 are derived from Lactadherin (BA-46). Those described in records Y82847-Y82859.

The peptide was isolated from a phagemid combinatorial library comprising the sequence V05953, by screening with an HLA-DQ4 molecule. The peptide is used for the treatment of autoimmune disease, or especially for treatment of viral diseases.
